The data on this catalogue refer to the standard product. The policy of Salami consists of a continuous improvement of its products. It reserves the right to change the specifications of the different products whenever necessary and without giving any information. If any doubts, please get in touch with our sales department.
Load sensing directional control valve VDP08 offers a load-independent flow control (flow in each section depends only by the spool position and not by the load acting on any function), good metering curves and chance of energy saving. The spool acts as a variable throttling on which the pressure drop is maintained constant, so that each spool position arouses a determinate flow rate.

**Closed centre version for variable displacement pumps**

The valve, through the LS signal, sets the pump displacement on the value required by the actuator plus a little leakage compensation flow, the pump always working almost at minimum power possible, with clear advantages in terms of energy saving.

When several spools are actuated, only the highest of the corresponding LS signals reaches the pump; in the remaining sections the compensators keep the pressure drop on the spool constant, maintaining the flow rate equal to that required by the actuator and independent of the pump pressure.

When all the spools are in neutral position (pump stand-by), the pump is required a very little flow (leakage compensation) at the stand-by pressure (14 bar - 200 psi).

**Open centre version for fixed displacement pumps**

The flow regulator in the inlet module, controlled by the LS signal, drains to tank all the flow exceeding the value required by the actuators, generating in the valve the same working conditions as in case of variable displacement pump. The advantages due to flow regulation hold, whereas energy saving is strongly cut down.

---

**GENERAL**

Among all hydraulic directional control valves used in the field of mobile equipment applications, the spool valve is the most popular.

The sectional valve type allows construction flexibility. Salami directional control valves are modular construction and consist of an inlet/outlet section, up to 8 working sections and an end plate. All these elements are secured in one block by means of tie-rods.

Salami directional control valves have the following features:
- Special cast-iron body;
- Spool construction in steel, hardened and chromium-plated to obtain a higher surface hardness, a better corrosion resistance, and wearing reduction;
- Minimum tolerance between spools and body to obtain a minimum internal leakage;
- Interchangeability of all spools;
- Possibility of auxiliary valves on port A and B
- Several spool controls.

DISTRIBUTION PHASES

There are two characteristic phases in the spool stroke (7 mm - 0.275 in.):

a) the overlap phase (about 18% of the stroke) guarantees minimum internal leakages in neutral position;
b) the progressive flow regulation phase (82% of the stroke).

*For higher back pressure please consult our Sales Department.

All technical data carried out using mineral oil with viscosity of 16 cSt and contamination level 19/16 as ISO 4406.
In order to meet the most stringent demands and to offer a wider range of applications, the following types of auxiliary valves and devices are available:

- **Valves on the inlet**
  
  **Main relief valve - VSLS** (see page 7A): controls the maximum pressure in the circuit acting on the LS signal that pilots the flow regulator.
  
  **Electric unloading valve - EV** (see page 9A): if not excited drains the LS signal preventing the valve operation (pump pressure set at the stand-by value 14 bar - 200 psi).
  
  **Flow regulator** (see page 7A): in the closed centre version serves the only function, driven by VS or EV, to drain the oil flow to tank;
  
in the open centre version it also regulates the flow rate.

- **Valves on the outlet**
  
  **Pressure reducing valve for electrically actuated valves** (see pages 16A and 17A): supplies the piloting pressure to electro-hydraulic remote controls.

- **Valves on the section**
  
  **LS pressure limiting valves on A and/or B ports - VSLS** (see page 14A): limiting the LS signal of the section control the pressure that the section can impose to the circuit. The shuttle valve allows different settings on the two ports.
  
  **Overload and anticavitation valve on port A and/or B - AR** (see page 14A): avoids pressure peaks on ports A/B connecting the port to tank when pressure exceeds the setting. It also serves an anti-cavitation function.
  
  **Anti-cavitation valve on port A and/or B - VR** (see page 14A): avoids cavitation due to inertia in the system.
  
  **Prearrangement for AR/VR and VSLS** (see page 14A): PR and PRVSLS.

**EACH DEVICE AND EACH CONFIGURATION REPORTED IN THIS CATALOGUE HAS A CORRESPONDING PART NUMBER IN THE DEALER CATALOGUE.**

**FOR ORDERING PART NUMBER, PLEASE CONSIDER THE DEALER CATALOGUE.**

**IN CASE OF MISSING PART NUMBER, PLEASE CONTACT OUR SALES DEPARTMENT.**
FEATURES

INSTALLATION

When proceeding to mount the unit on the structure and to connect fittings to work ports, it is necessary to comply with the values of tightening torques (see page 18A).

The attachment of linkages to spools should not affect their operation. The mounting position can be vertical with inlet module on the top or horizontal.

We recommend to fix the valve always using only 3 of the 4 fixing holes, otherwise make sure to interpose 4 rubber insulators between the valve and the machine frame, to avoid valve distorsion and spool sticking.

FILTRATION

The contamination of the fluid circulating in the system greatly affects the life of the unit. Above all, contamination may result in irregular operation, wear of seals in valve housings and failures. Once the initial cleanliness of the system has been attained, it is necessary to limit any increase of contamination by installing an efficient filtration system (see working conditions page 2A).

PIPES

Pipes should be as short as possible, without restrictions or sharp bends (especially the return lines).

Before connecting pipes to the fittings of the corresponding components, make sure that they are free from burrs and other contamination.

As a first approximation, for a mobile machine with standard length pipes, their width should guarantee the following values of fluid speed*:

<table>
<thead>
<tr>
<th>Fluid Speed</th>
<th>Pipe Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 ÷ 10 m/sec</td>
<td>inlet pipe</td>
</tr>
<tr>
<td>3 ÷ 5 m/sec</td>
<td>outlet pipe</td>
</tr>
<tr>
<td>19,7 ÷ 32,8 ft/sec</td>
<td>inlet pipe</td>
</tr>
<tr>
<td>9,9 ÷ 16,4 ft/sec</td>
<td>outlet pipe</td>
</tr>
</tbody>
</table>

the lowest values of fluid speed are required in case of wide temperature range and/or for continuous duty.

* \[ v = \frac{21.2 \cdot Q}{d^2} \]  
\[ v = \text{fluid speed [m/sec]}, \ Q = \text{flow [l/min]}, \ d = \text{pipe internal diameter [mm]} \]
FEATURES

HYDRAULIC FLUID

Usually a mineral-base oil with a good viscosity index should be used, preferably with good lubricating properties and corrosion, oxidation and foaming resistant.

Sometimes the fluids supplied by the manufacturers do not satisfy purity requirements (see WORKING CONDITIONS). It is therefore necessary to filter the fluid carefully before filling. Your supplier can give you the information about NAS class of its fluids. To maintain the proper purity class, the use of filters of high dirt capacity with clogging indicator is recommended.

Under humidity conditions it is necessary to use hygroscopic salts.

For operation with fire resistant and ecological fluids, please contact our technical department.

PORTS

Following are standard ports. For different port types, please contact our sales department.

Fixing holes distance between centers. The END PLATES are always threaded as shown beside. The INLET/OUTLET modules are threaded M8 UNI 4534 when the ports are GAS threaded and 5/16 - 18 UNC 2B ANSI B1.1 when the ports are SAE threaded.
INLET/OUTLET MODULES

OPERATING PRINCIPLES

OPEN CENTRE CIRCUIT WITH FIXED DISPLACEMENT PUMP
“CODE F” - SEE PAGE 8A

When the pump is started and main spools in the working modules are in neutral position, oil flows from the pump through port across the flow regulator to tank.

The oil flow led across the flow regulator determines the pump pressure (stand-by pressure of 14 bar - 200 psi).

When one or more of the main spools are actuated, the highest load pressure is fed through the shuttle valve circuit ("LS" pilot gallery, see hydraulic circuit at pag.11A) to the spring chamber behind the flow regulator, completely or partially closes the connection to tank.

Pump pressure is applied to the left-hand side of the flow regulator. The pressure relief valve poppet will open as soon as the load pressure will exceed the set value, so that the flow regulator will shift right diverting pump flow back to tank.

CLOSED CENTER CIRCUIT WITH VARIABLE DISPLACEMENT PUMP
“CODE V” - SEE PAGE 8A

In the closed centre version a throttling and a plug have been fitted instead of the plug.

This means that the flow regulator will only open to tank when the pressure in channel P exceeds the set value of the pressure relief valve. In load sensing systems the load pressure is led to the pump regulator via the “LS” port.

**INLET/OUTLET MODULES**

Inlet module circuit with LS electrical unloading valve - “EV”

---

**CIRCUIT DESCRIPTION:**

“EV” is an unloading electrovalve of the “LS” signal. “EV” is fitted into the inlet module enabling a connection between the “LS” and the tank lines. The “LS” signal can be relieved to tank switching the electrovalve by an electrical signal.

“EV” VALVE IN THE OPEN CENTRE CIRCUIT “CODE F”

For an open centre inlet module the relief to tank of the “LS” signal means that the pressure in the system is reduced to the difference of the tank port pressure and the inlet module pressure.

“EV” VALVE IN THE CLOSED CENTRE CIRCUIT “CODE V”

For a closed centre inlet module the relief to tank of the “LS” signal means that the pressure in the system is reduced to the difference of the tank port pressure and the stand-by pressure of the pump.

**Electrical unloading valve “EV”**

---

**Hydraulic circuit**

---
The "X" module allows to realize a parallel connection of two d.c.v. as showned on the side. The "X" module Instead to be equipped with a flow regulator it is just plugged in.

The hydraulic circuit shows the upstream d.c.v. with "F" inlet module (for fixed displacement pump) and the downstream valve with the "X" inlet module. The downstream d.c.v. takes the "LS" signal from the end module of the upstream d.c.v.

The same d.c.v. connection could be done with a "V" module in the upstream d.c.v. (for variable displacement pump). The end module of the upstream d.c.v. has to be designed as "U5".

EXAMPLE OF CIRCUIT TYPE
WORKING MODULES

WORKING MODULE WITH PRESSURE COMPENSATOR

GENERAL FEATURES

In a pressure-compensated working module the compensator maintains a constant pressure drop across the main spool - both when the load changes and when a module with a higher load pressure is actuated.

CIRCUIT CONFIGURATIONS

The pressure compensated working module is available in four circuit configurations (see figures beside), where you can introduce all the spool circuits that you can find from page 19A to page 22A. In this way we can have a vast range of circuit types. The drawings at page 12A show the components required to obtain the four different circuit configurations.

The plug 1 is used just to close a machining hole. The pivots 2 and 3 replace the plug 1 in case we have a single acting spool instead of a double. The pivot 4 is used with “LS” pressure limiting valves on A and B ports. It has a shuttle valve built-in that selects the “LSA” and “LSB” signals, coming from working ports and limited by “LS” pressure valves. To ensure a stabler “LS” signal the throttling C is always mounted. Throttling C can be removed if required.

AVAILABLE VALVE TYPES ON A/B PORTS

Available circuits

**PR - Prearranged for VR - AR**

**VR - Anti-cavitation valve**

**AR - Overload and anti-cavitation valve**

**VSLS - LS\textsubscript{A/B} - Pressure limiting valve**

**GENERAL FEATURES**

The hydraulic circuits of the different available valves are here shown, in the next page the valves location on the working module.

As shown on page 14A in drawing 1 a working module without valves, in drawing 2 a module with pre-arrangement for (VR) - (AR). Remind that the (AR) valve setting is fixed. In drawing 3 a module with two additional valve seats where the (VSLS) valves can be fitted. As shown in the circuit, this module offers the chance to pick up the “LS” signals from A and B ports removing the two plugs in the bottom of the module.
WORKING MODULES

AVAILABLE VALVE TYPES ON A/B PORTS

AR - Overload and anticavitation valve
VR - Anticavitation valve
PR - Prearranged for AR / VR
PRVSL S - Prearranged for VSLS
VSLS - LS pressure limiting valve
“U1” end plate integrates the reducing pressure valve (PRV) which draws "P" signal, when reducing it to a pressure of approx. 10 to 28 bar, sending it to "EC" circuit for feeding the electrohydraulic controls.
**SPECIFICATIONS**

- **MAX PRESSURE IN P**
  - 207 bar
- **MAX FLOW**
  - 10 l/min
- **OIL LEAKAGE**
  - 82 cc/min

- **PROTECTION INDEX WITH STANDARD CONNECTOR**
  - IP 65

**CONNECTOR**

- DIN 43650 - A/ISO 4400

**CODES**

- **12 Vcc - code U3**
- **24 Vcc - code U4**

**AVAILABLE CIRCUIT**

- **NORMALLY OPEN**
- **NORMALLY CLOSED**

“U2” end plate integrates the reducing pressure valve (PRV) which draws “P” signal, when reducing it to a pressure of approx. 10 to 28 bar, obtaining in this way an external piloting signal which can be used by a joystick or an electrovalve for to operate “IP” controls. In this case “EC” piloting inside the valve is plugged.

U3-U4 and U6-U7 end plates integrate (PRV) valve for electrohydraulic circuits and can also release the "EC" piloting by the electrovalve, which can be normally open or closed.
"U5" end plate allows to come out with "LS" signal in order to obtain a parallel circuit with a downstream VDP08 valve complete with a suitable inlet (see page 10A). This becomes possible when plugging "LS" signal (see figure).

**SPECIFICATIONS**
- MAX PRESSURE IN P" 207 bar
- MAX FLOW 10 l/min
- OIL LEAKAGE 82 cc/min
- AVAILABLE VOLTAGE 12 - 24 Vcc
- COIL RESISTANCE 12Vcc: 5.1 Ω - 24 Vcc: 20.5 Ω
- PROTECTION INDEX WITH STANDARD CONNECTOR IP 65

“U8-U9” and “U10-U11” end plates integrate (PRV) valve and can also release the “EC” external piloting by the electro valve, which can be normally open or closed.
“U12” end plate integrates the reducing pressure valve (PRV) which draws “P” signal when reducing it to a pressure of approx. 10 to 28 bar, sending it to “EC” circuit for feeding the electro-hydraulic controls. The by-pass valve can exclude the reducing pressure valve (PRV) and the electronic devices.

Special release made in order to be able to put in pressure VDP08 electro-hydraulic with a hand pump. The hand pump is commonly used as an emergency device in the field of aerial platforms. Before to order this code, please get in touch with our sales dept.

This assembling procedure is mainly suitable for customers who purchase VDP08 complete sections and assemble them by themselves, but can also be useful to add further working sections or to modify the circuit, replacing, a few parts when having a complete valve. Working sections and inlet modules are equipped with a small cylinder of teflon (see drawing “A”). This cylinder has to keep compressed the pressure compensator. If not, it could stop the fixing holes of the tie-rods. When assembling, you have to insert the tie-rods, which take out the teflon cylinder from its hole without any obstacle (see side picture). The necessary torque for the screws is 28 Nm.
DIRECTIONAL CONTROL VALVE
PRESSURE COMPENSATED

TYPES OF SPOOLS AVAILABLE

During the spools construction by appropriate notches dimensioning we can to obtain different type depending of the flow rates.

Each spool has a description with three digits, that allow to understand immediately the working principle and the flowrate.

EACH SPOOL WILL BE SUPPLIED WITH THE CORRESPONDING POSITIONING KIT

STANDARD MAIN SPOOLS FOR - SPS / SL / NL - CONTROLS

**code 01**
Double acting spool
(5 ways, 3 positions, A/B closed in neutral position)

**code 02**
Motor spool
(5 ways, 3 positions, A/B → T in neutral position)

**code 03**
Double acting motor spool port A (B port blocked)
(5 ways, 3 positions, B closed in neutral position)

**code 04**
Double acting motor spool port B (A port blocked)
(5 ways, 3 positions, A closed in neutral position)
VDP08

DIRECTIONAL CONTROL VALVE
PRESSURE COMPENSATED

TYPE OF SPOOLS AVAILABLE

**code 05**
Single acting spool (*"A"* working port)
(5 ways, 3 positions, A/B closed in neutral position)

**code 06**
Single acting spool (*"B"* working port)
(5 ways, 3 positions, A/B closed in neutral position)

The choice to have a single acting spool must be done on the body of the valve with the plugs showed at page 12A.
Therefore, for realizing spools code 05 and code 06 (single acting A or B) you need the spool code 01 in a circuit described at page 19A.

**code 11**
Double acting spool with float position
(5 ways, 4 positions, A/B closed in neutral position)

AVAILABLE ONLY WITH MANUAL CONTROL NL.
FLOAT POSITION CAN BE ACHIEVED ONLY PUSHING FORWARD THE LEVER.
THIS SPOOL CAN BE MOUNTED ONLY WITH LEVER ON "A" SIDE.

Before to order this code, please get in touch with our sales dept.

STANDARD MAIN SPOOLS FOR - FL - CONTROLS

<td>05</td>
<td>Single acting spool (&quot;A&quot; working port) (5 ways, 3 positions, A/B closed in neutral position)</td>
</tr>
<tr>
<td>06</td>
<td>Single acting spool (&quot;B&quot; working port) (5 ways, 3 positions, A/B closed in neutral position)</td>
</tr>
</tbody>
</table>

The choice to have a single acting spool must be done on the body of the valve with the plugs showed at page 12A. Therefore, for realizing spools code 05 and code 06 (single acting A or B) you need the spool code 01 in a circuit described at page 20A.

SPOOL CONTROL

GENERAL CAUTIONS FOR SPOOL CONTROL ASSEMBLING

On this and following pages are showned in details all the spool controls available. All the spool control and positioning devices can be mounted on both A and B sides, taking care to introduce always the spool in the A to B side direction. Because spool end threads are identical we can fit “X” hook spring device and “Y” plug on both spool end sides.

GENERAL FEATURES
The code “SPS” is a spool positioning kit that can be used with spool controls “PP-IP-KM”. The external adjusting screws “G” have to be used to reduce the spool stroke and consequently the port flow.

The code “SL” is the standard lever mechanism and can be used together with all spool controls. In case we have spool remote controls the “SL” device can be used as emergency lever. Also in this case the external adjusting screws “G” have to be used to reduce the spool stroke and consequently the port flow.
The code “NL” is the standard lever mechanism and can be used together with all spool controls. In case we have spool remote controls the “NL” device can be used as emergency lever. Also in this case the external adjusting screw “G” have to be used to reduce spool stroke and consequently port flow. This device cannot be used with remote spool controls.

The code “FL” is a manual lever mechanism with friction detent built-in, this device has to be used with spools shown on page 20A. This device cannot be used with remote spool controls.
The code “C2-C0” is a simple end plate used all the time we have “NL-FL” spool controls.

The code “IP” is a hydraulic proportional spool control. “M and N” are the pilot pressure ports. For example if we fit the “IP” device on “A” side the pilot pressure going in “N” port push the spool to “B” side direction allowing pump flow through working port “A”. When we supply pilot pressure to “M” port we pull the spool to “A” side allowing pump flow through working port “B”.

SPOOL CONTROL

PNEUMATIC PROPORTIONAL CONTROL

ELECTRO-PNEUMATIC ON-OFF CONTROL

12 V.d.c. - code P1
24 V.d.c. - code P2
In this type of valve the piloting lines “Pp and Tp” are built-into the casting, for this reason we can assemble the pressure reducing valve “C”, and the filter “D” directly on the end cover. Moreover VDP08 doesn’t need of a servo-piston to slide the spool on the working positions, in this valve the Pp line acts directly on the area made by the spool diameter. In order to send the Pp line at the other spool side, the casting is pre-arranged with the cavity “E”. In this assembly the mechanical interfaces “A” need only to assemble the “KE1/KE2” rather than the “KM/KMC” on the VDP08 side. With the actual working modules the Tp line goes into the main T line, we aren’t able to send it directly to tank separately.

In the VDP08 assembling the electronic spool positioning slides together in axis with the spool.
In order to adjust the flow with accuracy, we can reduce the spool stroke with the registers showed on the left.
The KM proportional actuator is designed to control the stroke of the main spool of the Salami directional control valve in response to a control signal. The control signal can be provided by an analog voltage source (e.g., a potentiometer) or the module can be integrated in a digital control environment.

The KM carries its function by controlling the currents of two proportional electrovalves and by measuring the spool position by means of an Hall effect linear transducer. This internal closed-loop position control makes the valve spool achieve the desired position with accuracy levels approaching the performance of a servo-valve.

The KM may shift the valve spool either directly (VDP08 version) or by means of a servo-position mechanically connected to it.

In a CAN bus operating mode, the remote control set point is processed via CAN bus according to ISO 11898 at 250 kbit/s by means of address-based (SAE J1939) or message-based (CAN 2.0B) protocols.

The microprocessor-based digital control of inherent functions (response time, flow rate presetting and spool position recovery after cut-off) makes it possible to adjust relevant parameters like PWM and DITHER frequencies, feedback algorithm during motion and under varying operative conditions (temperature changes, varying flow forces and off-set conditions of any kind) through a continuous teach-in process that will then maintain said parameters at their optimum level throughout the operative phase.
In the VDP08 assembling the electronic spool positioning slides together in axis with the spool.
In order to adjust the flow with accuracy, we can reduce the spool stroke with the registers showed on the left. In this case we are able to re-set the electronic board parameters to optimize the voltage signal with the new spool strokes. The working diagram above shows the comparison between the voltage signal and the standard spool stroke.
HOW TO ORDER

For standard hydraulic controls, please contact our technical service.

For electro-hydraulic controls, please contact our technical service.
